AUDIT AND INSIDER RISK · NETWRIX AUDITOR

Who changed that? You should be able to answer in minutes, not days.

Most breaches, outages and audit findings come down to one question: who did what, when, and from where. Windows records some of it, but scattered across servers and overwritten within days. Pinnacle uses Netwrix Auditor to collect that history in one place, keep it, and flag the activity that matters.

Questions you should be able to answer

01 Who added that account to Domain Admins last night?

02 Who deleted the shared folder, and what was in it?

03 Which files hold sensitive data, and who has been opening them?

What Pinnacle puts in place

Active Directory and Entra ID
Changes to users, groups, permissions and policies, recorded with who made them and when.

File servers and NAS
Changes, deletions, permission changes and failed access attempts on files and folders.

Microsoft 365
Activity across Exchange Online, SharePoint Online and OneDrive in the same view.

Sensitive data
Finds where sensitive files live and shows who is reading, changing or deleting them.

Alerts that matter
Near real-time alerts and anomaly detection for risky activity, watched by Pinnacle.

Reports auditors recognize
Prebuilt reports for HIPAA, PCI DSS, SOX, GDPR and CMMC.

Why Pinnacle: Netwrix fills the gap the rest of the security stack leaves. Huntress watches for attackers; Netwrix shows what any account, inside or out, actually did. Pinnacle reviews the alerts and the reports, so the history is read, not just stored.

See what your logs are not telling you.

Ask for a no-cost audit visibility review. We will show you who holds administrator rights, where sensitive files sit, and what your current logs could and could not tell you after an incident.
