VULSCAN by RapidFire Tools

VONAHI SECURITY

VULNERABILITY SCANNING AND PENETRATION TESTING

Find the holes before an attacker does.

VulScan checks your network on a schedule. Vonahi vPenTest runs a full network penetration test the way an attacker would. Pinnacle reads the results and fixes what they find.

What gets tested

Internal scans
Every device on your network

External scans
What the internet can see

Penetration tests
Real attacker techniques, chained together

Remediation
Findings fixed by Pinnacle, then rescanned

Why it matters

- **Cyber insurers ask** for scans and penetration tests.
- **Prioritized by real risk,** not a 300-page dump.
- **Progress tracked** from one scan to the next.
- **FTC Safeguards, HIPAA, PCI and CMMC** call for them.
- **Reports your leadership** can actually read.
- **Runs without disrupting** your operations.

The tools we use

VulScan by RapidFire Tools

- Scheduled internal and external scans
- New devices discovered automatically
- Risk-ranked findings with fixes
- Trend reports over time

Vonahi vPenTest

- Automated full network penetration test
- Shows attack paths and exposed credentials
- Executive and technical reports
- Run monthly, quarterly or annually

The FTC Safeguards Rule requires both.

Covered businesses need a penetration test every year and vulnerability assessments at least every six months, unless they monitor continuously. We schedule both and keep the reports.
